

# Line length should be more than 80 characters

The current default length of code lines are set to 80 characters, which properly is a legacy from the time of 14" monitors. The current 1600\*1200 or more monitors are capable of displaying 250+ characters before needing a line wrap, which makes the 80 char limit seem rather constraining. The code is after all the primary information we work with in our development, so it feels unnatural to allocate only 20-25% of the screen for the actual code. The result is a lot of line wraps in the code, especially if you try to classify your classes, methods and variables with more informative names (as not to mention something like submitNewJobList).
