

Database crash test

Tests that the system can survive a database crash/stop and resume operation after the database is restarted

1. Logging as root on kb-test-adm-001

```
ssh kb-test-adm-001  
su
```

2. Stop the postgresdb and wait a couple of minutes.

```
/etc/init.d/postgresql stop
```

3. Verify that the GUI has lost the connection to the database by listing domains or harvest definitions.
4. Restart the database

```
/etc/init.d/postgresql start
```

5. Check that the different GUI pages works as usual.
6. Create a new active selective and verify the a job is created and started.
