

Get File IDs

Gets list of [file](#) identifiers from a pillar, i.e. the identifiers of the data objects placed on the pillar. The GetFileIDs operation will typically be used in connection with integrity check.

Examples of use of the GetFileIDs operation can be found in connection with description of subprocesses of the integrity client: [Collect integrity inf. process](#) and [Collection communication](#).

Get File IDs User Stories

- [Simple Use of GetFileIDs with Result in Complete Message](#) — In the simple user story, we use the Identify Primitive to identify pillars; we use the GetFileIDs Primitive to request the FileIDs from the pillar with the shortest TimeToDeliver; we return the FileIDs in the Complete message; there are no error messages or alarms.
- [Use of GetFileIDs by Integrity Client](#) — The Scenario is: GetFileIDs from different pillars to integrity client.
