

Bitrepository 1.2 is out

Highlights

- The integrity and audit trail service ingest processes are now much faster and scale to millions of files. The same goes for the checksum reference pillar.
- The thread model for the services has also been improved, allowing the service tomcat to run with a much smaller memory footprint (256MB) and makes it possible to be shutdown the tomcatserver cleanly.
- Audit trail collection schedule information has been added to the GUI.
- The alarm service now uses a durable listener to avoid losing alarms during alarm service downtime.

See [Reference system 1.2](#) release notes for details.
