

# BitRepository clients

Describes the clients used for accessing the BitRepository system.

In production, a [Commandline client](#) can be used. This commandline client comes with the release / snapshot of the reference BitRepository.

Another client that is used in production is the reference [WebClient GUI](#), which provides a visual overview of the pillars and their collections. It also provides access to addition [services](#) like [Integrity service](#) and [Alarm service](#).

There are other applications at [KB](#) that also acts as clients, calling the commands from the reference code. These applications are i.e. Kuana and NetarchiveSuite.

The following is a deprecated idea for the NetarchiveSuite.

## **NetarchiveSuite archive POC**

POC usage by the NetarchiveSuite project as bitrepository.
